Suggested Clinical Review Actions

- Elevated Breathing (avg 27 brpm, peak 40 brpm): Check SpO2 and lung sounds; assess for fluid overload or early infection
- Low Heart Rate (avg 44 bpm, min 41 bpm): Check pulse and BP; review beta blockers and AV node agents; ECG if symptomatic
- Very High Breathing (avg 44 brpm, peak 46 brpm): Check SpO2, work of breathing, fever; consider pulmonary cause or CHF
- High Breathing (avg 35 brpm, peak 46 brpm): Check SpO2, work of breathing, fever; consider pulmonary cause or CHF
- Overall trajectory shows 6 unstable phases with 17 bpm variability. Consider increasing monitoring frequency and lowering escalation threshold.

Clinical Pattern Observations:

- 1. **Clustered pattern:** Episodic events on 5 of 53 days (9%).
- 2. **Daytime pattern:** Episodes concentrated during waking hours.

Red bars indicate days with detected episodic events.

Monitoring Activity

Bars indicate monitoring hours/day. Red threshold line indicates clinical monitoring baseline.

■ HR episode ■ RR episode ■ Recorded, no episode ■ No data

Episodic event: threshold exceeded continuously for ≥ 1 hour. Episodes separated by ≤ 1 hour of normal vitals are counted as the same event. Brief threshold crossings that do not sustain are not flagged.
