RR values outside physiologic range (6–60 breaths/min).

Suggested Clinical Review Actions

- Elevated Breathing (avg 27 brpm, peak 57 brpm): Check SpO2 and lung sounds; assess for fluid overload or early infection
- High Breathing (avg 31 brpm, peak 43 brpm): Check SpO2, work of breathing, fever; consider pulmonary cause or CHF
- Very High Breathing (avg 41 brpm, peak 44 brpm): Check SpO2, work of breathing, fever; consider pulmonary cause or CHF
- Overall trajectory shows 6 unstable phases with 19 bpm variability. Consider increasing monitoring frequency and lowering escalation threshold.

Clinical Pattern Observations:

- 1. Breathing variability: RR spread 11 bpm (10 to 21).
- 2. Clustered pattern: Episodic events on 5 of 42 days (11%).

Red bars indicate days with detected episodic events.

Monitoring Activity

Bars indicate monitoring hours/day. Red threshold line indicates clinical monitoring baseline.

■ HR episode ■ RR episode ■ Recorded, no episode ■ No data

Episodic event: threshold exceeded continuously for ≥ 1 hour. Episodes separated by ≤ 1 hour of normal vitals are counted as the same event. Brief threshold crossings that do not sustain are not flagged.
