SECTION 1 — Clinical Intelligence: Signal Summary and Trajectory

Over 7 days of monitoring, 122 of 168 expected hours were recorded (72.6% coverage). 9 episodic events spanning 50 total hours were detected, including: Elevated Breathing Rate, High Heart Rate, Low Heart Rate, Very Low Heart Rate. The period showed 2 distinct phases. **Phase 1: Low HR + Elevated RR (Jun 24 to Jun 26):** Heart rate dropped to lows of 40 bpm with 2 episodes showing concurrent elevated breathing rate. **Phase 2: HR Surge (Jun 27 to Jun 30):** Heart rate surged with daily averages reaching 76 bpm and peaks near 109 bpm. The P5 to P95 heart rate spread was 55 bpm (47 to 101), indicating significant cardiac variability. 2 episodes showed concurrent low heart rate with elevated breathing rate, a coupling pattern that may reflect compensatory respiratory stress. Monitoring signal declined to only 3 hours on June 30, limiting visibility into the final day.

Trend: Progressively unstable vital sign patternAction: Provider review advised

Suggested Clinical Review Actions

- Phase 1: Low HR + Elevated RR (Jun 24 to Jun 26): Very Low Heart Rate for 10 hours (min HR 40 bpm). Review heart rate lowering medications, check blood pressure, assess oxygen levels and fluid status due to concurrent elevated breathing rate.
- Phase 2: HR Surge (Jun 27 to Jun 30): High Heart Rate for 4 hours (avg HR 102 bpm). Evaluate for pain, infection, fever, dehydration, or heart rhythm change.
- Overall trajectory shows 2 unstable phases with 40 bpm variability. Consider increasing monitoring frequency and lowering escalation threshold.
